Art Unit: 2182

DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 2/9/2009 has been entered.

Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 12 17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ninomiya (US Patent Number 5,809,330) in view of Nakashima (US Patent Number 6,029,211).
- 4. As per claim 12, Ninomiya teaches a method for determining the function of a circuit board (expansion unit, element 2, figure 1) disposed in a slot (detection via connectors, element 26 and 27, figure 1) in an enclosure comprising the steps of:

displaying an identifying characteristic of the slot inside of the enclosure (expansion connector detecting various possible characteristics in the form of multitude of expansion devices, column 7, lines 53 – 58, displaying the identifying characteristic as per the specification 0020 is represented by an obstruction of the light by the circuit board which is analogous to the obstruction of the photo-sensors as seen in column 8, lines 4 - 20, and identification is also capable through detection of a change in voltage to certain pins of the connector, column 8, lines 31 – 34, the identifying characteristic in itself is a sensor that can determine a change in its state);

Page 3

detecting the circuit board (upon connection routed to system bus for characteristics further determined by photo-sensors, column 7, lines 66-67, column 8, lines 1-10, the photo-sensors are the initiator in the process to determine the characteristic of the inserted option card, see further explanation for claim 1); and

directing the circuit board to perform the function associated of the slot (CPU enables connectors and determining of characteristics between expansion unit and main unit, element 11, figure 1).

Ninomiya does not teach a characteristic of a binary representation that allows for a multifunction circuit that associates the particular function based on the detected binary characteristic.

Nakashima teaches a method in which a characteristic is identified in a binary representation for directing a multifunction circuit board to perform a particular function associated with the detected characteristic (column 6, lines 40 – 58, CIS characteristic utilized to determine function of card) detecting the displayed characteristic on the

Art Unit: 2182

circuit board (column 6, lines 31 - 39); interpreting the detected characteristic on the circuit board (column 6, lines 34 - 39, function); and directing the circuit board to perform the function associated with the interpreted characteristic of the slot (column 6, lines 40 - 43).

It would have been obvious to one of ordinary skill in the art at the time of the applicant's invention to modify the teachings of Ninomiya with that of Nakashima. One of ordinary skill would make such modification in order to reduce overhead of driver installation of functions not being utilized by the PC (column 2, lines 18 - 24).

- 5. As per claim 13, Ninomiya teaches a method wherein said means located within said enclosure for displaying a characteristic of the slot comprises means for generating at least one signal, and at least one tab disposed within the interior of the slot capable of substantially reducing the at least one signal (light from photo emitter to photoreceptor is considered at least one signal generated, column 8, lines 7 10).
- 6. As per claim 14, Ninomiya teaches a method wherein said means disposed on said circuit board for detecting the characteristic of the slot comprises means for detecting the at least one signal (photo sensors, elements 30-31, figure 1).
- 7. As per claim 15, Ninomiya teaches a method wherein said means for generating at least one signal comprises a source of light (photo emitter, column 8, lines 7 10), and wherein said means for detecting the characteristic of the slot comprises at least

Art Unit: 2182

one light detector (photo-sensor, element 30, figure 1) adapted for detecting light generated from said source of light.

- 8. As per claim 16, Ninomiya teaches a method wherein said means displaying a characteristic of the slot comprises at least one source of light; and said means for detecting the characteristic of said slot comprises at least one light detector adapted for detecting light generated by said at least one source of light, whereby the pattern characteristic of the slot is reproduced by said at least one light detector.
- 9. As per claim 17 a method wherein said means for detecting the characteristic of the slot comprises at least one microswitch (microswitch, column 8, lines 33 35) and said means for displaying a characteristic of the slot comprises at least one projection positioned on a wall of said enclosure disposed in a pattern characteristic of the slot and adapted to actuate one of said at least one microswitch when said circuit board is inserted into the slot, such that the characteristic of the slot is sensed by said at least one microswitch (mechanically detected by means of microswitch through detection of a change in voltage to certain pins of the expansion connector, column 8, lines 27 35).
- 10. Claims 1 10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ninomiya in view of Nakashima further in view of Lee (US Patent Number 5,748,912).

12. As per claim 1, Ninomiya teaches an apparatus for determining the function of a circuit board (expansion unit, element 2, figure 1) disposed in a slot (detection via connectors, element 26 and 27, figure 1) in an enclosure and in electrical communication with said enclosure (laptop-type environment, figure 1), which comprises in combination: (a) means located within said enclosure for displaying an identifying characteristic of the slot (expansion connector detecting various possible characteristics in the form of multitude of expansion devices, column 7, lines 53 – 58); (b) means disposed on said circuit board for detecting the characteristic (upon connection routed to system bus for characteristics further determined by photosensors, column 7, lines 66-67, column 8, lines 1 – 10, the photo-sensors are the initiator in the process to determine the characteristic of the inserted option card); and (c) a processor for interpreting the detected characteristic and for directing said circuit board to perform the function associated therewith (CPU enables connectors and determining of characteristics between expansion unit and main unit, element 11, figure 1).

Ninomiya does not teach a characteristic of a binary representation that allows for a multifunction circuit that associates the particular function based on the detected binary characteristic.

Nakashima teaches a method in which a characteristic is identified in a binary representation for directing a multifunction circuit board to perform a particular function associated with the detected characteristic (column 6, lines 40 – 58, CIS characteristic utilized to determine function of card).

It would have been obvious to one of ordinary skill in the art at the time of the applicant's invention to modify the teachings of Ninomiya with that of Nakashima. One of ordinary skill would make such modification in order to reduce overhead of driver installation of functions not being utilized by the PC (column 2, lines 18 - 24).

Ninomiya/Nakashima does not disclose a processor disposed on said circuit board.

Lee analogously teaches an option card (figure 2b) with a processor disposed on said circuit board (CPU 402, figure 4a).

It would have been obvious to one of ordinary skill in the art at the time of the applicant's invention to insert the option card of Lee into the option card slot of Ninomiya/Nakashima. One of ordinary skill in the art would be motivate to make such modifications in order to allow for an efficient and flexible means for users to replace a processor in a unit without exorbitant costs (column 2, lines 1 – 10).

- 13. Ninomiya/Nakashima modified by the teachings of Lee as applied in claim 1 above as per claim 2, Ninomiya teaches the apparatus wherein said means located within said enclosure for displaying a characteristic of the slot comprises means for generating at least one signal, and at least one tab disposed within the interior of the slot capable of substantially reducing the at least one signal (light from photo emitter to photoreceptor is considered at least one signal generated, column 8, lines 7 10).
- 14. Ninomiya/Nakashima modified by the teachings of Lee as applied in claim 1

Art Unit: 2182

above as per claim 3, Ninomiya teaches an apparatus wherein said means disposed on said circuit board for detecting the characteristic of the slot comprises means for detecting the at least one signal (photo sensors, elements 30-31, figure 1).

- 15. Ninomiya/Nakashima modified by the teachings of Lee as applied in claim 1 above as per claim 4, Ninomiya teaches an apparatus wherein said means for generating at least one signal comprises a source of light (photo emitter, column 8, lines 7 10), and wherein said means for detecting the characteristic of the slot comprises at least one light detector (photo-sensor, element 30, figure 1) adapted for detecting light generated from said source of light.
- 16. Ninomiya/Nakashima modified by the teachings of Lee as applied in claim 1 above as per claim 5, Ninomiya teaches an apparatus wherein said at least one tab is disposed in a pattern characteristic of the slot, and said at least one light detector, reproduces the pattern characteristic of the slot (indication of the option card generated based on signal DTE2, column 8, lines 21 27).
- 17. Ninomiya/Nakashima modified by the teachings of Lee as applied in claim 1 above as per claim 6, Ninomiya teaches an apparatus wherein the light generated from said source of light is substantially reduced by said at least one tab when said at least one tab is disposed between said source of light and said at least one light detector (passage of light block upon insertion of option card substantially reducing the light

Art Unit: 2182

generated from the source in reference to the opposing photo-sensor, column 8, lines 21 - 24).

- 18. Ninomiya/Nakashima modified by the teachings of Lee as applied in claim 1 above as per claims 7 and 9, Ninomiya teaches an apparatus wherein said at least one source of light comprises at least one light emitting diode (photo-emitter, column 8, lines 7-10) and said at least one light detector comprises a charge-coupled detector (photo-receptor, column 8, lines 10-13).
- 19. Ninomiya/Nakashima modified by the teachings of Lee as applied in claim 1 above as per claim 8, Ninomiya teaches an apparatus wherein said means displaying a characteristic of the slot comprises at least one source of light; and said means for detecting the characteristic of said slot comprises at least one light detector adapted for detecting light generated by said at least one source of light, whereby the pattern characteristic of the slot is reproduced by said at least one light detector.
- 20. Ninomiya/Nakashima modified by the teachings of Lee as applied in claim 1 above as per claim 10 an apparatus wherein said means for detecting the characteristic of the slot comprises at least one microswitch (microswitch, column 8, lines 33 35) in electrical communication with said processor, and said means for displaying a characteristic of the slot comprises at least one projection positioned on a wall of said enclosure disposed in a pattern characteristic of the slot and adapted to actuate one of

Art Unit: 2182

said at least one microswitch when said circuit board is inserted into the slot, such that the characteristic of the slot is sensed by said at least one microswitch (mechanically detected by means of microswitch through detection of a change in voltage to certain pins of the expansion connector, column 8, lines 27 - 35).

- 21. Claims 11 and 18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ninomiya in view of Nakashima further in view of Lee further in view of Pope et al. (US Patent Number 4,781,066).
- 22. Ninomiya/Nakashima modified by the teachings of Lee as applied in claim 1 above as per claims 11 and 18, fails to teach and apparatus wherein said means disposed on said circuit board for detecting the characteristic of the slot comprises a Hall-effect apparatus.

Pope et al. analogously teaches an apparatus wherein said means disposed on said circuit board for detecting the characteristic of the slot comprises a Hall-effect apparatus (element 75, figure 6, column 6, lines 36 – 40).

It would have been obvious to one of ordinary skill in the art at the time of the applicant's invention to modify the combination of Ninomiya and Lee with the above teaches of Pope et al. One of ordinary skill would have been motivated to make such modification in order to have a detection system that permits enhanced sensitivity and noise immunity in the system (column 7, lines 7 - 10).

Art Unit: 2182

Response to Arguments

23. Applicant's arguments with respect to claims 1 - 18 have been considered but are most in view of the new ground(s) of rejection.

Applicant's arguments are directed to newly amended limitations of a binary characteristic which is utilized to determine the functional characteristic of the multifunction circuit. All arguments are directed to amended claims which have been newly rejected under the functional characteristics of Nakashima and therefore moot.

Conclusion

24. Any inquiry concerning this communication or earlier communications from the examiner should be directed to AURANGZEB HASSAN whose telephone number is (571)272-8625. The examiner can normally be reached on Monday - Friday 9 AM to 5:30 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Tariq Hafiz can be reached on (571)272-6729. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
